Converting a number into standard form involves a systematic approach. Here are the essential steps:

Step 1: Identify the Significant Figures

Determine the non-zero digits of the number. These digits form the coefficient between 1 and 10.

Step 2: Move the Decimal Point

Shift the decimal point so that it is immediately after the first significant digit.

Step 3: Count the Number of Moves

Count how many places you moved the decimal point:

- To the left for numbers greater than 1.
- To the right for numbers less than 1.

Step 4: Write in Scientific Notation

Express the number as:

- Coefficient (the number between 1 and 10),
- Multiplied by 10 raised to the power equal to the number of decimal moves.

Example:

Convert 0.0056 to standard form:

- Significant figures: 5.6
- Move decimal 3 places to the right to get 5.6
- Since moving right, exponent is negative.
- Final form: 5.6 × 10?³

Performing Operations in Standard Form

Practicing operations with numbers in standard form is crucial. Below are the key rules:

Addition and Subtraction

- Ensure the exponents are the same.
- If not, adjust the coefficients by shifting the decimal.
- Add or subtract the coefficients.
- Keep the common exponent.

Example:

(3.2 × 10?) + (1.5 × 10?) = (3.2 + 1.5) × 10? = 4.7 × 10?

Multiplication

- Multiply the coefficients.
- Add the exponents.

Example:

(2.5 × 10³) × (4 × 10?) = (2.5 × 4) × 10^(3+4) = 10 × 10? = 1 × 10?

Division

- Divide the coefficients.
- Subtract the exponents.

Example:

(6.4 × 10?) ÷ (2 × 10²) = (6.4 ÷ 2) × 10^(5?2) = 3.2 × 10³
