Exercise: Using a dataset on wages and education, estimate the effect of years of schooling on

wages, perform hypothesis testing, and interpret the results.

Solution Highlights:

- Load dataset in Stata/R
- Run OLS regression: `regress wage education`
- Check the coefficient significance
- Conduct t-tests for hypotheses (e.g., is the coefficient of education zero?)
- Interpret the economic meaning of the estimated coefficient

Educational Value: Reinforces fundamental regression analysis steps with clear explanations.

Example 2: Addressing Heteroskedasticity

Exercise: Test for heteroskedasticity in the wage regression and adjust standard errors accordingly.

Solution Highlights:

- Use Breusch-Pagan test or White test
- Apply robust standard errors: `regress wage education, robust`
- Discuss implications of heteroskedasticity on inference

Educational Value: Demonstrates diagnostic testing and correction methods, vital for credible inference.

Resources and Accessibility

Solutions are often bundled with the textbook or available through:
